The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1-8 are rejected under 35 U.S.C. 103(a) as being unpatentable over Hughes (newly cited) in view of applicants' admitted prior art. Hughes discloses a process for removing phosphorus from liquid manure, wherein an industrial byproduct from a metal manufacturing process is used to treat the manure. (See the Abstract and col. 6, lines 11-50.) The difference between the process disclosed by Hughes, and that recited in applicants' claims, is that Hughes does not specifically disclose that the industrial byproduct should be byproducts of electrolysis and foundry. Applicants' admit in Paragraph [0007] that the magnesium industry is producing by-products of electrolysis and foundry, which represent a waste for that industry. It would be obvious to employ the byproducts of electrolysis and foundry of the admitted prior art process as the industrial byproduct from a metal manufacturing process used in the process of Hughes. One of ordinary skill in the art would be motivated to do so, since Hughes teaches at col. 8, lines 45-52 that any metal or metal oxide manufacturing process which produces large-scale, commercially applicable amounts of byproducts that immobilize bio-available phosphorus in soil or organic waste, that are optionally rich in calcium and iron, and which are suitable as soil additives alone or in combination with organic waste, as defined by the Environmental Protection Agency guidelines, falls within the method of the invention. It would appear that by-products of electrolysis and

foundry would comport with this definition. There is no evidence on record of unexpected results which would emanate from the use of by-products of electrolysis and foundry, as opposed to the byproducts specifically disclosed by Hughes, in treating manure to remove phosphorus.
